

# Suppl. Figure 2. Differential bacterial abundance across Tissue and Luminal microbiome

## null device  
## 1

**Suppl. Figure 2.** Differential bacterial abundance across tissue and CVL microbiome week3 datasets. The results are shown both as **a)** Dot plots and **b)** barplots. Bacteria with log2FC above 0.25 and p-value below 0.01 (from the wilcoxon test) were considered significant and were sorted by the highest expression. The colour scale indicates the difference in total abundance between the datasets as a proportion, where Max is the highest abundance of the two datasets and the other becomes a proportion of this value. The size of the dots indicates the average abundance of the given bacteria in the given dataset.
